Q1 2026 market update

Investors are increasingly reassessing the health and positioning of the global bank loan asset class amid a backdrop of macroeconomic uncertainty and headline-driven volatility. Recent developments, including escalating trade policy uncertainty following the reimposition of broad-based tariffs, heightened geopolitical tensions in the Middle East, and sector-specific stress tied to AI-driven disruption of legacy software business models (commonly referred to as the 'SaaSocalypse'), have amplified concerns around credit risk and the resilience of corporate issuers. We view these developments as meaningful, but not uniformly negative for the loan market. Rather, they reinforce the longstanding need, in our view, to discover and invest in issuers with durable competitive positioning. Against this backdrop, three key questions have emerged:

- 1) How are underlying bank loan issuers performing in the current market?
- 2) How does a higher-for-longer rate environment affect loan returns?
- 3) What is the outlook for the loan asset class?

This piece provides our view on the current market environment and attempts to answer these critical questions.

Why loans now?

In our view, there are three compelling reasons to consider investing in senior secured loans today:

1) Potential high level of current yield

Yield is driven by two primary components: income and price appreciation. For loans, the income component remains particularly compelling. Higher-for-longer base interest rates and persistently wide credit spreads support elevated income levels allowing loan yields to remain attractive relative to historical norms. Market expectations continue to point to interest rates staying above pre-2022 levels reinforcing this income advantage. In addition, loans are currently trading at an average price of approximately 94 in the US and European markets, providing incremental potential for price appreciation alongside income¹. Historically, leveraged loans have delivered consistent and relatively stable returns across a range of market environments, including recessionary periods and cycles of declining rates.

2) Resilience to interest rate changes

Bank loans are uniquely positioned in today's market to deliver high income potential regardless of the direction of interest rates. As floating-rate instruments, their coupons reset regularly to SOFR potentially helping insulate investors from the price volatility that affects traditional bonds. Whether rates rise or fall, loan prices are not directly linked to interest rate volatility and have continued to generate attractive income.

In the current higher-for-longer rate environment, floating-rate loans can benefit directly: elevated base rates translate into higher coupons and greater income for investors. At the same time, interest rate movements are notoriously difficult to predict. As a floating rate asset class, when rates rise, coupons increase; when rates fall, loans reset lower but still offer competitive yields relative to other fixed income segments such as high yield bonds. Moreover, declining rates ease the interest expense burden on borrowers, improving issuer fundamentals and reducing default risk. This flexibility makes loans a reliable source of income in both rising and falling rate environments, making this worth considering in portfolios.

3) Compelling relative value

Loans have consistently provided some of the most attractive yields in the fixed income market, while also offering downside risk mitigation due to their senior position in the capital structure and being secured by a company's assets.

In 2025, high yield bonds outperformed loans largely driven by the longer duration of high yield bonds benefiting from rates falling^{1,2}. However, much of that duration trade is now priced in. High yield bond spreads have compressed to historically tight levels limiting forward return potential. In contrast, loan spreads remain near their long-term averages, and loans continue to trade at a

discount, creating a potentially appealing entry point and price-upside opportunity as spreads normalize.

Loans also offer these high yields with potentially lower risk. In a recessionary scenario, loans can provide further downside risk mitigation due to their senior secured status, which gives them the highest priority for repayment in the event of default. Historically, this seniority has translated into stronger recovery rates and lower credit losses during economic downturns reinforcing their role as a resilient asset class with historically positive annual returns.

Yields

Loan yields are currently attractive both historically and relative to high yield bonds. With loans offering higher all-in yields and trading below par, investors may benefit from elevated income potential and modest price appreciation compared to high yield bonds^{1,2}.

Senior Loans: A Core Holding In Any Environment

Since 2022, loans have been one of the best-performing asset classes—mitigating downside risk in 2022 and benefiting from rising rates in 2023—resulting in two of the strongest years for the asset class since the Global Financial Crisis³. Loans have offered amongst the highest yields in fixed income and are expected to remain elevated as the market anticipates a higher-for-longer interest rate environment⁴.

Asset class resiliency

While high yield bonds outperformed loans by roughly 250 basis points in 2025, much of that upside may already be priced in the market. The duration trade has largely run its course, and looking ahead, we believe senior loans may be better positioned to deliver higher income especially since forecasting interest rate moves remains inherently difficult. Loans' floating rate structure offers built-in flexibility making loans a strategic component in diversified portfolios particularly when the direction (and magnitude) of interest rates are uncertain.

Market technicals

There was a steady flow of new CLO creation globally through 2025. This indicates that there is still strong institutional investor appetite for loans. This steady CLO formation helped support the loan market technical despite retail outflows and macro concerns in early 2025, with CLOs representing over 70% of the investor base in the loan market.³ Globally, 569 CLOs priced totaling over \$276 billion in 2025, building on 2024 which saw 553 CLOs price over \$254 billion.³ In the US, 429 CLOs priced over \$208 billion, while in Europe, 140 CLOs priced over €60 billion, both representing record-setting levels of net new issuance.³ CLOs continue to be the major source of institutional demand, and historically, as demand for loans wanes, new loan issue supply will typically respond in kind to help re-establish equilibrium in the market. For example, global year-end 2023 net issuance was \$89.83bn, which is about -55% year-over-year.³ As demand for loans increased throughout 2024 and 2025, net issuance increased to \$167.68 and \$198.99, respectively.³ This dynamic interplay between supply and demand helps provide price stability in the loan market.

Relative valuations also favor bank loans compared to high yield bonds. Loan spreads are currently near their long-term average, while high yield bond spreads are at their tightest (expensive) since 2009. Loans have also been outyielding high yield bonds with loan coupons being historically high.

Market fundamentals

Market fundamentals for underlying loan issuers remain relatively strong.

Recent volatility in the technology sector has reflected investor concerns that rapid advances in artificial intelligence could accelerate the obsolescence of certain legacy software products and business models. Importantly, we do not view this as indicative of broader credit weakness or systemic stress in the loan market. While some software-focused lenders have experienced notable losses, the broader effects have remained contained. Overall, we maintain a constructive outlook on the loan market which continues to be supported by strong and resilient credit fundamentals. Importantly, this environment reinforces the importance of distinguishing between issuers with durable competitive advantages and those more vulnerable to technological disruption.

The US and European trailing twelve-month default rate at the end of March 2026 was 1.43% and 1.42%, respectively.³ While the risk of defaults remains the largest risk to loan investors, it is important to note that we believe defaults are expected to have peaked and will fall throughout 2026. Additionally, the senior secured nature of loans has historically provided a high recovery rate in the event of default. Furthermore, firms that go through liability management exercises tend to have higher recovery rates compared to those that do not.

Distressed ratio serves as a good leading indicator of potential default activity

Sources: PitchBook Data, Inc.; Morningstar LSTA US Leveraged Loan Index, Morningstar European Leveraged Loan Index. Data through March 31, 2026, updated quarterly.

We still see the risk/return opportunity stronger in the loan market than in high yield which has seen spreads compress. The average leverage of companies in the leveraged loan market serves as an indicator of the financial health of bank loan issuers. The majority of borrowers continue to have healthy balance sheets, and average leverage in the market has returned to pre-pandemic levels. Borrowers have also pushed out their debt maturities with fewer than 1% of loans maturing in 2026. This leaves little refinancing risk in the market³.

Another important investor concern is how current rates will impact issuers' ability to service their debt. The average borrower has entered this cycle with a very strong ability to service their debt. Interest coverage ratios have remained robust indicating that companies continue to have sufficient capacity to meet their interest obligations. We expect these ratios to strengthen further throughout 2026.

Borrower fundamentals remain healthy across the loan market

Conclusion

As we look ahead, we believe senior secured loans remain well positioned to deliver attractive risk-adjusted returns. While the broader credit landscape continues to evolve marked by shifting interest rate expectations, tighter spreads, and headline-driven volatility, loans can offer compelling value through high income, discounted entry points, and resilient credit fundamentals.

In 2025, US Loans delivered a total return of 5.94% (8.15% interest return, -2.21% principal return), and European Loans delivered 4.00% (6.71% interest return, -2.71% principal return)¹. This highlights the asset class's ability to generate meaningful income even in a volatile price environment. Coupons are projected to remain above historical averages especially as interest rates remain elevated.

We believe the story of fixed income returns going forward is carry, not duration. With many loans trading at a discount to par, investors also have the potential to benefit from capital appreciation as loans mature at face value. The current environment of wider spreads and discounted prices may offer an attractive entry point for investors with a longer time horizon.

For investors seeking stability, yield, and resilience across market cycles, senior secured loans may continue to stand out as a strategic allocation. Loans have historically proven resilient across

⁴Invesco. There is no guarantee that the forecast will be realized. Forecast is based on coupon plus wider nominal spreads minus base rate declines minus price erosion.

a range of economic environments offering an evergreen option for investors navigating market fluctuations. Recent volatility tied to AI-driven disruption and conflicts in the Middle East, while notable, underscores this resilience. These disruptions have not translated into broader systemic weakness within the loan market. As shown below, declines in loan values have typically been short-lived. Regardless of topical credit disruptions or a shifting interest rate environment, the loan asset class has consistently delivered attractive returns for investors.

Downticks in loan valuation have historically been short-lived

Source: S&P UBS as of March 30, 2026.

Investment risks

Many senior loans are illiquid, meaning that the investors may not be able to sell them quickly at a fair price and/or that the redemptions may be delayed due to illiquidity of the senior loans. The market for illiquid securities is more volatile than the market for liquid securities. The market for senior loans could be disrupted in the event of an economic downturn or a substantial increase or decrease in interest rates. Senior loans, like most other debt obligations, are subject to the risk of default. The market for senior loans remains less developed in Europe than in the U.S. Accordingly, and despite the development of this market in Europe, the European Senior Loans secondary market is usually not considered as liquid as in the U.S. The value of investments, and any income from them, will fluctuate. This may partly be the result of changes in exchange rates. Investors may not get back the full amount invested.
