It is not intended for and should not be distributed to or relied upon by the public or retail investors.

# Executive Summary

- + **The Strategic Perspective.** The year ended on a high note, with most assets posting positive returns during the last quarter of the decade. Risk-on sentiment crept through the trade-tension headlines as a phase one agreement came to be, calming market fears. US large cap equities were up significantly in the fourth quarter, bringing calendar-year 2019 returns to the largest one-year gain since 2013! Even developed non-US equities, a laggard in the expansion, participated in the quarter's rally. One might think all is rosy in markets, but as strategic investors, we must position ourselves for a less optimistic path. Decelerating global growth, lofty valuations across asset classes and a debt overhang at uncharted levels are all reasons we are not blindly starting this decade with the same portfolio we held 10 years ago. Looking forward, we are constructing portfolios to weather the ups and downs, which is why diversification is central to our investment thesis. Absolute returns will be hard to come by, and for those concerned with risk-adjusted figures, the next 10 years could be challenging. A US or Global 60/40 may not be enough for those seeking nominal returns above 5%. Non-US equities, albeit with more risk, and alternatives, like hedge funds and commodities, are the most attractive long-term CMAs relative to their historical returns (**Figure 1**). Direct investments in Private Equity and Debt could provide diversification against US overvaluation, expected increases in volatility, and declining yields.
- + **The Tactical View.** Over the next few months we expect our leading economic indicators to deteriorate, especially for China and emerging markets due to the coronavirus, "catching-up" with the information currently discounted by asset prices. The impact to developed markets leading indicators will likely be more modest, but negative nonetheless. Following these developments, we have rotated a portion of our equity exposure from Emerging markets (EM) into Developed markets (DM), resulting in an underweight position to emerging equities versus an overweight to DM both domestic and international. The recent deterioration in the macro environment has also led to a meaningful outperformance in defensive equity factors such as quality and low volatility, which we expect to continue in an environment of increasing risk aversion and downward revisions to growth. Barring renewed easing rhetoric by global central banks, the decline in bond yields over the past month appears appropriate, flattening yield curves once again and largely reflecting the increased risk aversion.

## The strategic perspective

Providing our clients with a smooth investment experience is one of our core objectives. Our goal is to construct portfolios that will partake in the upswings with a risk-aware approach to minimizing drawdowns in downturns and we are fortunate to have robust analytic tools and risk diagnostics at our fingertips. Understanding the headwinds investors could face over the coming cycle, we are focused on diversifying assets to mitigate risk, enhance returns and navigate the uncertainty ahead.

Investors in US equities and broadly in fixed income, are likely to face a very different return experience going forward. The standard US 60/40 equity/fixed income portfolio is expected to return 4.3% in US dollars, on average, through 2030, less than half the return provided over the most recent decade with about a quarter higher risk (9.9%) (**Figure 2**). A similar but less dramatic experience is expected for global equities, given more attractive valuations and higher yields. Emerging markets and Non-US developed markets appear more likely positioned to provide higher returns over the next decade, albeit with slightly higher levels of volatility. Alternatives present opportunities for both higher returns and risk reduction, particularly in direct investments such as private equity and private debt.

Meeting with our global base of clients, we hear a common concern of where to allocate capital when valuations are full, growth is low, and uncertainty is high. Fixed income returns look rather bleak, due to low or negative yields. Investors are turning to equities to fill this income void, a partial reason why many defensive sectors were bid up to lofty valuations in 2019. As long-term investors, we are focused on ensuring our asset classes are serving their intended purposes, as to not get confused by the short-term noise. We expect equities to provide price appreciation first and income secondarily. If investors follow this mantra of “make your fixed income work smarter, and equities work harder,” we can begin to add diversification beyond these traditional assets in the form of alternative risk premia.

The unique backdrop whereby investors have been penalised for diversification is a theme we plan to capitalise on over the next decade. If volatility does increase as we expect, alternative strategies should provide investors with risk-mitigation through diversification. Selectivity will be important for investing late in the business cycle. From a risk-adjusted perspective, we believe US large caps are more attractive than their smaller counterparts, but in absolute terms, we favor small caps. Equities in the UK and Asia Pacific have attractive return prospects but are expected to have above-average volatility. Within fixed income assets, we prefer shorter duration and high-quality credit risk. Due to how flat, negative or inverted yield curves are around the world, long-term fixed income prospects are less attractive. Overall, we believe the next decade will be notably different from the last. Our strategic view is that investors should maintain a focus on diversification in the face of the unique challenges of lower yields, lower returns on capital, increased volatility, and higher correlations.

Executive Summary 02

Global Macroeconomic Outlook 03

2020 Capital Market Assumptions - Q1 Update 06

**Alessio de Longis**  
Senior Portfolio Manager,  
Invesco Investment Solutions

## The tactical view<sup>2</sup>

The coronavirus presents a sudden exogenous shock to the global growth cycle, at a time when the world economy was on the cusp of a new synchronised cyclical upswing. Within our macro regime framework, this negative shock has led to a noticeable decline in our market sentiment indicator, foreshadowing downward revisions to future growth expectations, particularly for China and the rest of emerging Asia (**Figure 3**). In our last update, we had indicated how this region was likely to lead the impending global cyclical upturn based on information from our leading economic indicators; however, the regional concentration of the coronavirus shock directly challenges this thesis, at least for now. In light of this new information, our framework places the global economy in a **contraction regime** for the near-term, i.e. growth below-trend and expected to decelerate. The duration of this regime is likely to depend on two things: 1) the duration of the virus outbreak and 2) its impact on the economy.

### Duration of the virus outbreak: likely over by the spring

From this perspective, the virus outbreak per se is unlikely to derail the global growth outlook for 2020, as it is reasonable to assume the outbreak will follow the typical path of any seasonal flu, which hits most of the northern hemisphere this time of year, and largely runs its course within 2-3 months, i.e. by the spring. Indeed, this is also what we experienced with SARS in 2003, which provided a similar near term hit to markets and growth and ran its course by mid-April. Therefore, by itself the outbreak can be considered a temporary economic event.

### Impact on the economy: temporary and longer-lasting shocks

The growth impact is likely to be most pronounced in China and the rest of Asia, particularly for Q1 2020, driven by the disruption to economic activity caused by quarantines, factories shutdowns and canceled transportation services. Revenues from consumer spending, travel and tourism services are likely to suffer the most given the Lunar New Year holidays. However, this should represent only a one-off, temporary drag to growth. On the contrary, the industrial side is likely to experience both a near-term shock and a more uncertain long-term drag. The loss of Chinese output in Q1 will likely lead to a sharp drawdown in inventories, followed by a similarly sharp rebound in production in Q2 and Q3, depending on the disruption to global supply chains and global demand outside the region. Given the much larger share of global GDP coming from China today (~18% compared to 5% in 2003), the impact to global growth is likely to be larger than during the SARS episode. On the positive side, the meaningful decline in industrial commodity and energy prices (~10% year-to-date) should provide some support to industrial and consumer demand going forward.

In summary, over the next few months we expect our leading economic indicators to deteriorate, especially for China and emerging markets, “catching-up” with the information currently discounted by asset prices. The impact to developed markets leading indicators will likely be more modest, but negative nonetheless. More importantly, we will continue to monitor trends in global risk appetite to gauge whether economic data will surprise positively or negatively versus financial markets expectations.

### Figure 3: Duration of the virus outbreak: likely over by the spring

Coronavirus shock to market sentiment challenges the nascent growth recovery, increasing near-term downside risks in a below-trend growth environment.

Sources: Federal Reserve, BEA, Moody's, Jan. 31, 2020. GRACI is an acronym for IIS' proprietary Global Risk Appetite Cycle Indicator.

**Figure 4: Impact on the economy: temporary and longer-lasting shocks**

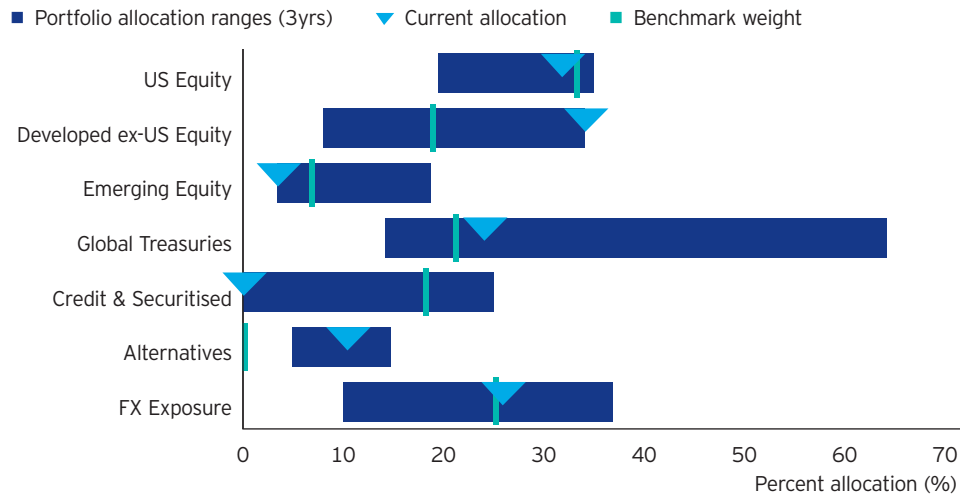

Leading Indicators likely to dip back into contraction, especially for China and emerging markets.

Sources: Invesco Investment Solutions proprietary research, Jan. 31, 2020.

Following these developments, we have rotated a portion of our equity exposure from emerging into developed markets, resulting in an underweight position to emerging equities versus an overweight to developed markets both domestic and international (Figure 5). The recent deterioration in the macro environment has also led to a meaningful outperformance in defensive equity factors such as quality and low volatility, which we expect to continue in an environment of increasing risk aversion and downward revisions to growth. Finally, barring renewed easing rhetoric by global central banks, the decline in bond yields over the past month appears appropriate, flattening yield curves once again and largely reflecting the increased risk aversion.

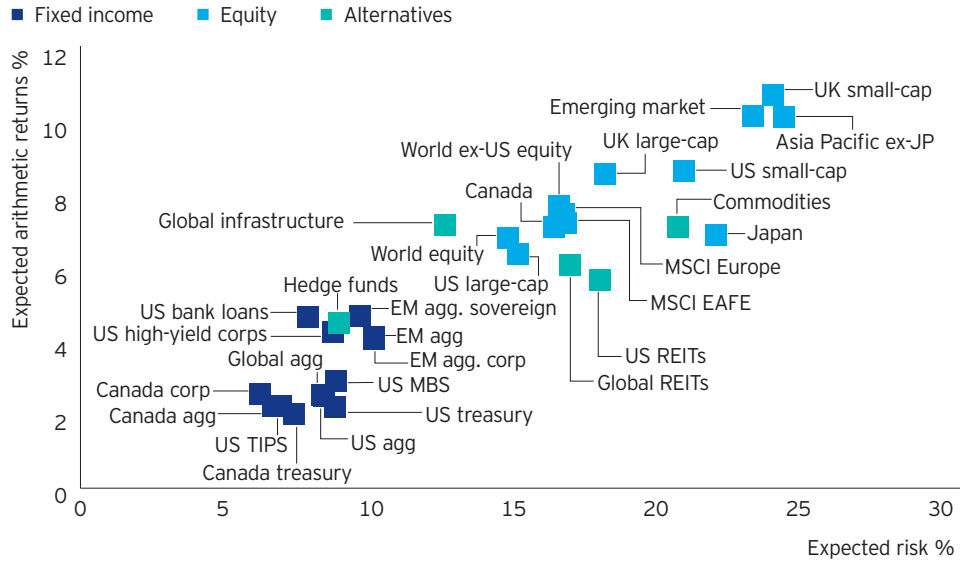

**Figure 5: Tactical Moderate Portfolio vs. Global Benchmark**

### About our capital market assumptions methodology

We employ a fundamentally based “building block” approach to estimating asset class returns. Estimates for income and capital gain components of returns for each asset class are informed by fundamental and historical data. Components are then combined to establish estimated returns (Figure 14). Here we provide a summary of key elements of the methodology used to produce our long-term (10-year) estimates. Five-year assumptions are also available upon request. Please see Invesco’s capital market assumption methodology whitepaper for more detail.

**Figure 14: Our building block approach to estimating returns**

For illustrative purposes only.

**Fixed income** returns are composed of:

- + **Average yield:** The average of the starting (initial) yield and the expected yield for bonds.
- + **Valuation change (yield curve):** Estimated changes in valuation given changes in the Treasury yield curve.
- + **Roll return:** Reflects the impact on the price of bonds that are held over time. Given a positively sloped yield curve, a bond’s price will be positively impacted as interest payments remain fixed but time to maturity decreases.
- + **Credit adjustment:** Estimated potential impact on returns from credit rating downgrades and defaults.

**Equity** returns are composed of:

- + **Dividend yield:** Dividend per share divided by price per share.
- + **Buyback yield:** Percentage change in shares outstanding resulting from companies buying back or issuing shares.
- + **Valuation change:** The expected change in value given the current Price/Earnings (P/E) ratio and the assumption of reversion to the long-term average P/E ratio.
- + **Long-term (LT) earnings growth:** The estimated rate in the growth of earning based on the long-term average real GDP per capita and inflation.

**Currency adjustments** are based on the theory of Interest Rate Parity (IRP) which suggests a strong relationship between interest rates and the spot and forward exchange rates between two given currencies. Interest rate parity theory assumes that no arbitrage opportunities exist in foreign exchange markets. It is based on the notion that, over the long term, investors will be indifferent between varying rate of returns on deposits in different currencies because any excess return on deposits will be offset by changes in the relative value of currencies.

**Volatility estimates** for the different asset classes, we use rolling historical quarterly returns of various market benchmarks. Given that benchmarks have differing histories within and across asset classes, we normalise the volatility estimates of shorter-lived benchmarks to ensure that all series are measured over similar time periods.

**Correlation estimates** are calculated using trailing 20 years of monthly returns. Given that recent asset class correlations could have a more meaningful effect on future observations, we place greater weight on more recent observations by applying a 10-year half-life to the time series in our calculation.

**Arithmetic versus geometric returns.** Our building block methodology produces estimates of geometric (compound) asset class returns. However, standard mean-variance portfolio optimisation requires return inputs to be provided in arithmetic rather than in geometric terms. This is because the arithmetic mean of a weighted sum (e.g., a portfolio) is the weighted sum of the arithmetic means (of portfolio constituents). This does not hold for geometric returns. Accordingly, we translate geometric estimates into arithmetic terms. We provide both arithmetic returns and geometric returns given that the former informs the optimisation process regarding expected outcomes, while the latter informs the investor about the rate at which asset classes might be expected to grow wealth over the long run.

Invesco Investment Solutions is an experienced multi-asset team that seeks to deliver desired client outcomes using Invesco's global capabilities, scale and infrastructure. We partner with you to fully understand your goals and harness strategies across Invesco's global spectrum of active, passive, factor and alternative investments that address your unique needs. From robust research and analysis to bespoke investment solutions, our team brings insight and innovation to your portfolio construction process. Our approach starts with a complete understanding of your needs:

- + We help support better investment outcomes by delivering insightful and thorough analytics.
- + By putting analytics into practice, we develop investment approaches specific to your needs.
- + We work as an extension of your team to engage across functions and implement solutions.

The foundation of the team's process is the development of capital market assumptions – long-term forecasts for the behavior of different asset classes. Their expectations for returns, volatility, and correlation serve as guidelines for long-term, strategic asset allocation decisions.

Assisting clients in North America, Europe and Asia, Invesco's Investment Solutions team consists of over 60 professionals, with 15+ years of experience across the leadership team. The team benefits from Invesco's on-the-ground presence in more than 20 countries worldwide, with over 150 professionals to support investment selection and ongoing monitoring.

## About the Invesco Global Market Strategist office

The GMS office is comprised of investment professionals based in different regions, with different areas of expertise. It provides data and commentary on global markets, offering insights into key trends and themes and their investment implications.

**Investment risks**

The value of investments and any income will fluctuate (this may partly be the result of exchange rate fluctuations) and investors may not get back the full amount invested.

Invesco Investment Solutions develops CMAs that provide long-term estimates for the behavior of major asset classes globally. The team is dedicated to designing outcome-oriented, multi-asset portfolios that meet the specific goals of investors. The assumptions, which are based on 5- and 10-year investment time horizons, are intended to guide these strategic asset class allocations. For each selected asset class, we develop assumptions for estimated return, estimated standard deviation of return (volatility), and estimated correlation with other asset classes. This information is not intended as a recommendation to invest in a specific asset class or strategy, or as a promise of future performance. Estimated returns are subject to uncertainty and error, and can be conditional on economic scenarios. In the event a particular scenario comes to pass, actual returns could be significantly higher or lower than these estimates.
